USP & USE CASE DOCUMENT

USP 1 — Apply & Track, All in One Place

Today, applying for a government scheme means juggling multiple websites, offices, and follow-up visits — with no single place to see where things stand. Margdarshak changes that. From the moment you start an application to the day your benefit is received, everything happens inside one app. A clear visual progress bar shows exactly where each application stands, so users always know what's done, what's next, and what's waiting — without having to chase anyone for an update.

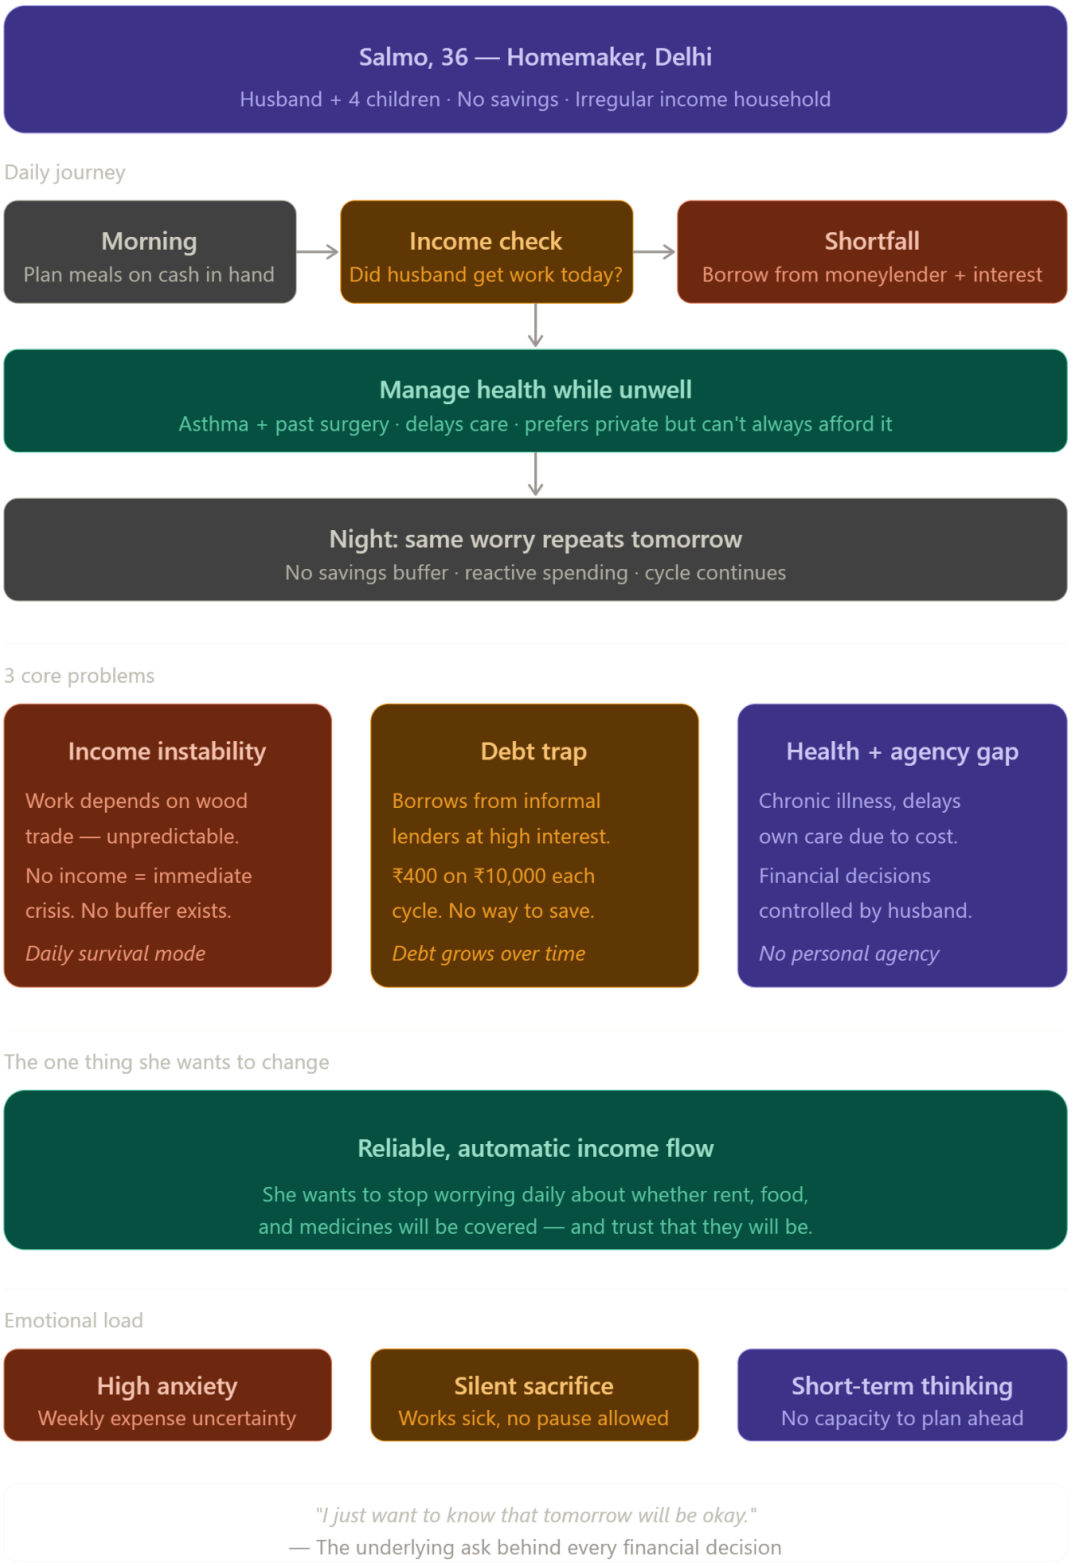

USP 2 — Schemes Recommended Just for You

Most people don't apply for government schemes because they don't know they qualify. Margdarshak removes that barrier entirely. During onboarding, users share a few basic details — their state, income range, and family composition — and the app instantly surfaces every scheme they are already eligible for. No searching, no guesswork. The right schemes find the user, not the other way around.

USP 3 — Guides Who've Been There

Sometimes a screen isn't enough. For users who need in-person support — whether due to low literacy, unfamiliarity with digital processes, or simply the complexity of a particular scheme — Margdarshak connects them with real community guides: local people who have personally navigated the same application process. These are not call centre agents. They are neighbours, familiar faces from the same area, who understand the local offices, the local language, and the real-world obstacles that stand between an eligible family and their benefit.

USE CASE SCENARIO

User Journey

Here's Salmo's user journey laid out visually. To summarise in words:

Her daily loop is a survival cycle — every morning she checks whether her husband got work, and if not, she either cuts expenses to the bone or borrows from a moneylender. She manages the household while dealing with her own health conditions, and goes to bed facing the same uncertainty the next day.

The 3 core problems compound each other. Income instability creates the crisis, informal debt makes it worse over time, and her lack of financial agency means she can't act on her own to break the cycle — every decision passes through her husband first.

The one change she wants isn't wealth or savings in the abstract. It's something much simpler: *predictability*. She wants to wake up knowing rent, food, and medicines are covered — not scramble to figure it out each day. Automatic, reliable income flow is her version of peace of mind.

What she represents is a household that is not poor from lack of effort or awareness — she is poor from lack of a safety net. One income shock (husband falls ill, wood prices drop) is all it takes to push the family into a deeper debt spiral.

WHY THIS MATTER

Based on the independently verified data, here's the clearest picture possible:

CENTRAL SCHEMES

Metric	Number	% of Population
Total population	145 crore	100=----------
Enrolled / covered (ILO verified)	94 crore	64%
Actively using / receiving tangible benefits	~72–75 crore	~50–52%

Enrolled but dormant / not benefiting	~19–22 crore	~13–15%
Not covered at all	~51 crore	~36%

The gap that matters: Of the 94 crore enrolled, roughly **20–23% are enrolled but inactive** — best illustrated by PMJDY where 13 crore accounts are officially dormant. PM-JAY similarly has only 37 crore cards issued against a target of 55 crore eligible families, meaning a large chunk never even enrolled.

STATE SCHEMES

Region	Covered	Actively Using	Gap (enrolled but inactive)
Southern (TN, Kerala, AP, TS)	~55–60%	~55–65%	Smallest gap, ~5–10%
Western (MH, GJ, RJ)	~50%	~45–55%	~10–15% gap
Northern/Central (UP, Bihar, MP)	~45%	~35–45%	Largest gap, ~15–20%
North-East/Himalayan	~45%	~40–50%	~10–15% gap

One honest caveat: The state-level numbers have no single verified official source — they are derived from fund utilization rates, claims data, and DBT payouts. The central numbers are more reliable, anchored to ILO data and scheme-specific ministry reports. The state gap is real but the exact percentages should be read as directional ranges, not precise figures.

Layout : Grid 4 column- , layouts: horizontal and grid beta, Alignment - types

Accessibility : AI , components
components and its types

1. Primary Persona:

- Age: 35–50 years
- Context: Migrated or semi-urban worker living away from hometown. Works long hours (10–12 hrs) in jobs like construction, service work, driving, or facility maintenance. Income is low and unstable or just sufficient for monthly survival. Supports a family and often sends money home.
- Digital confidence: Basic to low. Uses a smartphone for calls, WhatsApp, YouTube, and sometimes UPI. Avoids complex apps, government portals, or forms without

guidance. Fear of mistakes in digital processes.

- Income / background:
    - ₹10,000–18,000 per month.
    - 10th–12th education.
    - Lives paycheck-to-paycheck with little or no emergency savings. Often has informal debt (moneylender/chit fund).

- Motivation:
    - Financial stability and predictable future
    - Children's education and family security
    - Avoid debt and emergencies
    - Access government benefits if easy and trustworthy

- Frustration:
    - Government schemes are confusing and document-heavy
    - Fear of being rejected or wasting effort
    - No clear guidance on eligibility or process
    - Financial uncertainty (medical emergency, job gaps)
    - Trust issues with digital and financial systems

- Behavioral pattern:
    - Relies on cash or simple banking
    - Saves small amounts informally (chit, loose cash, RD)
    - Relies on word-of-mouth information
    - Avoids hospitals or formal services unless necessary
    - High mental load about future risks

- Decision style:
    - Slow and cautious
    - Trust-based (contractor, friend, local shop, spouse)
    - Needs simple language and step-by-step help
    - Chooses safe and familiar options over new ones

2. User Journey:

Across all your research participants (Raju, Ranjan, Bhanu, Venu, Rajeesh, Selvi, Ramu, Kamli, Salma), one clear pattern stands out:

“Lack of accessible, trustworthy, and easy-to-navigate support systems (financial, healthcare, and government schemes)”

This is not just about money — it’s about **decision burden + system complexity + lack of guidance**.

Why this is systemic (not individual):

- People **know help exists** (schemes, savings, healthcare)
- But they **don’t act** because:
    - Processes are confusing
    - Fear of rejection or making mistakes
    - No trusted guidance
    - No time/energy after work
- Result → They fall back to:
    - Local moneylenders (high interest)
    - Self-medication
    - Informal advice networks
    - Daily survival decisions instead of long-term planning

1. Trigger Stage (Need Arises)

Situation:

- Needs money (food, school fees, medical)
- Or hears about a scheme / benefit

Actions:

- Thinks about possible options
- Asks nearby people

Pain Points:

- No clear starting point
- Information is scattered

Emotion:
😟 Confused + overwhelmed

---

2. Exploration Stage (Trying to Figure It Out)

Actions:

- Asks friends, coworkers, employers
- Searches a little (if possible)
- Considers applying for scheme / loan / treatment

Pain Points:

- Conflicting information
- Doesn't trust sources
- Doesn't understand eligibility/process

Emotion:
😕 Doubt + hesitation

---

3. Decision Stage (Critical Drop-off Point)

Actions:

- Decides whether to:
    - Apply for scheme
    - Go to hospital
    - Take loan
    - Ignore problem

Pain Points:

- Fear of:
    - Rejection
    - Wasting time
    - Embarrassment
- No step-by-step guidance

Behavior Pattern:
👉 Avoids formal systems

Emotion:
😣 Anxiety + fear

---

4. Fallback Stage (What They Actually Do)

Actions:

- Borrow from moneylender
- Self-medicate / delay care
- Eat less / manage somehow
- Take extra work

Pain Points:

- High interest debt
- Health risks
- Physical + mental exhaustion

Emotion:
😞 Stress + helplessness

---

5. Outcome Stage (Short-term Survival)

Result:

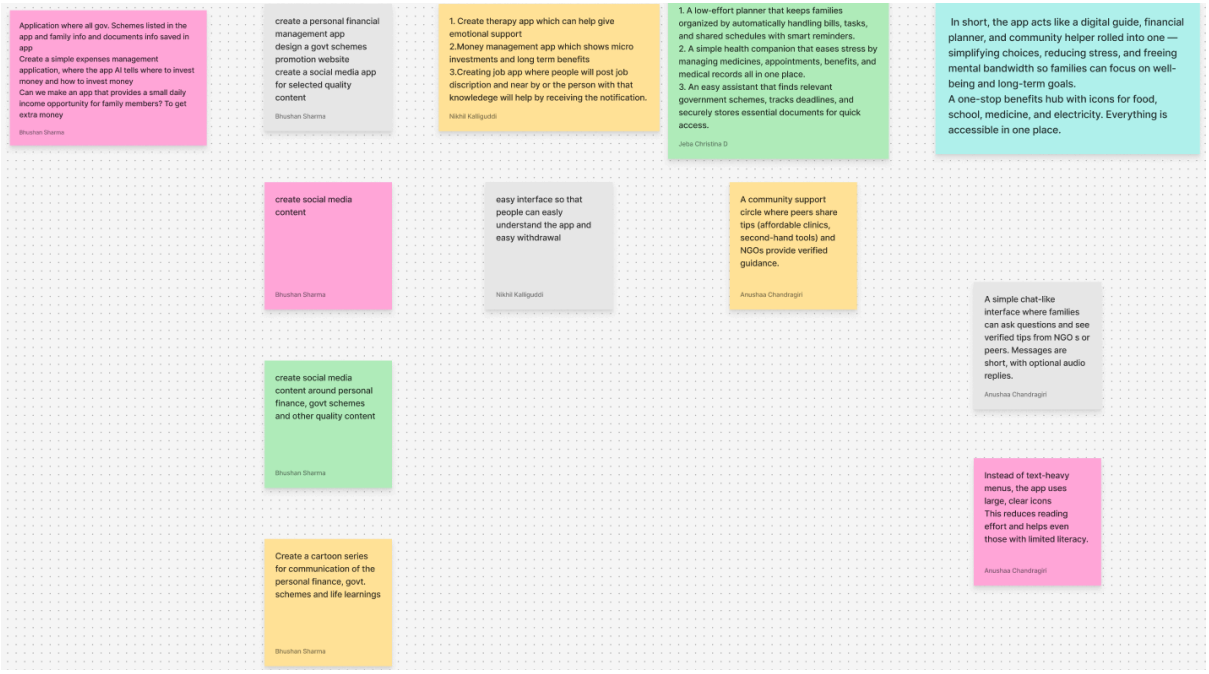

- Immediate problem solved (temporarily)

But:

- No long-term improvement
- Cycle repeats

Emotion:
😔 Relief (temporary) + ongoing worry

3. Ideation:

4. Information Architecture:

Information Architecture (IA) defines how content, features, and interactions are **structured, connected, and accessed** within **Margdarshak**. Given that Margdarshak addresses **User's need, Easy navigation, Reduce cognitive load, Trusted source**, the IA had to be intentionally simple, predictable, and emotionally safe.

Margdarshak IA prioritize:

- Guide support
- Family management
- Recommended scheme
- Easy navigation

4.1 Design Philosophy Behind the Architecture

Our main aim is to focus on low income, uneducated individuals or families.

- Individuals should understand the interface easily and navigate through the process smoothly.
- With more illustration and less text to reduce cognitive load.
- This app also helps guide support.
- Recommend the scheme based on the information provided in the beginning.

4.2 Entry Flow Architecture (Onboarding to Home)

The entry flow establishes **Trust, User needs and Recommendation**

FLOW image

Flow includes:

- Splash Screen
- Language Selection
- Select State
- Select Occupation
- Select Annual income
- Login
- Home screen

Why this matters:

- Instead of pushing users directly to the scheme section, it helps us to understand what scheme the user is looking for by answering the relevant question.

4.3 Navigation Architecture

Margdarshak uses a **flat, bottom-navigation–based structure** to ensure quick access without overwhelming users.

Navigation architecture image

Navigation Tab includes:

- Home
- Scheme
- Guide
- Profile

4.4 Home Screen as Central Anchor

The home screen acts as functional anchor of the app.
Home screen includes:

- Recommended for you scheme
- Browse by category
- AI Assistance for scheme search

4.5 Core Features

- AI assistance for scheme search and to explain the requirement of the scheme
- Guide support
- Manage Family

4.6

4.7 Profile & Control Architecture

Flow image

Includes:

- Edit Profile
- Manage Document
- Manage Family
- Manage Address
- Language
- Notification
- Help Center
- Feed Back
- More Setting
